WEEKLY REPORT

Week Ending
March 11, 1967

PUBLIC HEALTH SERVICE

CURRENT TRENDS - MEASLES - 1967

The total number of measles cases reported for the 10th week (ending March 11, 1967) is 2,537, which exceeds the total for the previous week by 147 but is 6,360 less than the 8,897 cases notified during the comparable week of 1966. Five states reported 56 percent of the total cases: Alabama - 175; California - 235; Texas - 668; Virginia - 115; Washington - 231. New Hampshire reported 54 cases, 52 of which were delayed reports. The greatly decreased number of reported cases of measles for the current epidemiological year, compared with epidemiologic years 1965-66, 1964-65, and 1963-64, is shown in Figure 1.

Figures 2, 3, and 4 show the trends of reported measles from 1962 through the 8th week of 1967 for the East South Central, West North Central, and East North Central Regions, respectively. In these figures the trends shown for the states in each of these Regions may be compared with that of the Region as a whole. In the East South Central and in the West North Central Regions, the trend of measles has been very similar, with the epidemic year

Smallpox - Regensburg, Federal Republic of Germany ..	84

1963-64 preceded and followed by two non-epidemic years. In the East North Central Region, there appears to have been two successive epidemic years followed by two non-epidemic years. An examination of the curves of the states within this Region reveals that cases in Michigan and Wisconsin during epidemiologic year 1962-63 largely account for the differing pattern of the East North Central Region. Because of the generally known one-to-two-year cyclic pattern of measles, 1966-67 might be expected to be an epidemic year in all three of these Regions. There is no indication, however, in the presently available data that this expectation will become fact as epidemiologic year 1966-67 advances.

(Reported by the Childhood Viral Diseases Unit, Epidemiology Program, NCDC).

INTERNATIONAL NOTES

SMALLPOX - Regensburg, Federal Republic of Germany

An imported case of smallpox in Regensburg, a city of 125,000 in the state of Bavaria, was reported to the World Health Organization by the West German Federal Ministry of Health on March 11, 1967. The infection has occurred in a 58-year-old German woman who manages a toy shop in Regensburg. She had been on vacation in India with a tour group during the first 3 weeks of February. The last 3 days before her return to Germany had been spent in Bombay, an area declared by WHO as locally infected with smallpox.

On February 20, she began her return trip home, arriving February 22. She remained in good health until March 2 when she complained of feeling indisposed. On March 4 she became febrile and complained of severe headache and aching of her limbs. On March 6 she consulted a physician who made the diagnosis of a flu-like illness. On March 8, 4 days after the onset of fever, the patient noted a skin rash.

By March 10, she had been hospitalized and a diagnosis of smallpox, fulminating type with secondary hemorrhage, had been presumptively confirmed by electronmicroscopic visualization of poxvirus particles in scrapings made from vesiculo-pustular skin lesions. Similar lesion material inoculated on the chorio-allantoic membrane of embryonated eggs was reported positive for variola virus on March 13, confirming the presumptive findings. All diagnostic studies have been performed at the Bavarian Vaccine Institute laboratories under the direction of Professor A. Herrlich.

The patient is isolated at the Regensburg Hospital where she remains critical ill. She reportedly had been vaccinated as a child and revaccinated 2 years ago when she made another trip abroad; however, examining physicians have not been able to discern an old primary vaccination scar or locate a certificate of vaccination.

A total of 119 persons have been quarantined in a local school. They include all known face-to-face contacts since March 2 and all persons living in the eight apartments of the 3-story building where the patient resides and has her shop. As of March 14, no secondary cases have been reported.

A total of 16,000 persons have been vaccinated in Regensburg; eight of the initial 11 vaccination stations opened on March 11 remain active. Vaccine supplies are ample to provide for all exigencies.

All 35 air travelers on her return flight from Bombay have been located in Germany, France, and Switzerland and their local health authorities notified. None of these persons nor any contacts of the patient in Regensburg are known to have subsequently traveled to the United States.

Regensburg is to be considered a noninfected local area as the one case is an importation from India.
(Compiled from telegraphic report of March 12, 1967, from WHO; Dr. Huston K. Spangler, MOC, PHS Foreign Quarantine Program, American Consulate, Munich, Germany.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 17,000, IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER DAVID J. SENCER, M.D.
CHIEF, EPIDEMIOLOGY PROGRAM A.D. LANGMUIR, M.D.
ACTING CHIEF, STATISTICS SECTION IDA L. SHERMAN, M.S.

IN ADDITION TO THE ESTABLISHED PROCEDURES FOR REPORTING MORBIDITY AND MORTALITY, THE NATIONAL COMMUNICABLE DISEASE CENTER WILL MAINTAIN ACCOUNTS OF INTERESTING OUTBREAKS OR CASE INVESTIGATIONS WHICH ARE OF CURRENT INTEREST TO HEALTH OFFICIALS AND WHICH ARE DIRECTLY RELATED TO THE CONTROL OF COMMUNICABLE DISEASES. SUCH COMMUNICATIONS SHOULD BE ADDRESSED TO:

THE EDITOR
MORBIDITY AND MORTALITY WEEKLY REPORT
NATIONAL COMMUNICABLE DISEASE CENTER
